TRANSDUCER COORDINATE DIAGRAM

The spherical coordinate system is used to define the angles in the directivity pattern: θ and ϕ shown in the above diagram give the directions in which the response is measured. The transducer is placed in the frame of reference with its axis of symmetry coincident with $\theta = 0^\circ$, its fiducial mark in the $\phi = 0^\circ$ plane, and its center at $r = 0$.

The two patterns most frequently measured are:

- (1) those made by holding ϕ constant at some angle and rotating θ through 360° .

$(\phi = a^\circ; \text{rotate } \theta)$

- (2) those made by holding θ constant at some angle and rotating ϕ through 360° .

$(\theta = b^\circ; \text{rotate } \phi)$

Measured at TRANSDEC
